

# Bootcamps vs. Traditional College

Because many individuals want a higher income, they will attend traditional college in fields such as software engineering, cybersecurity, and data analytics.

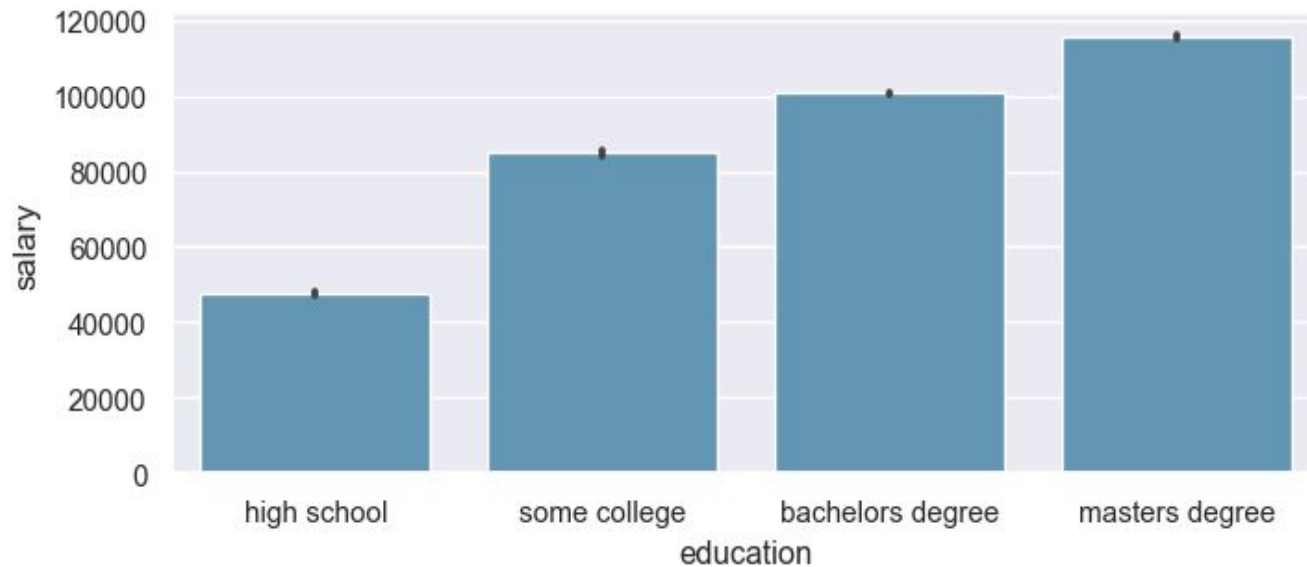

Distribution of Salary Among Workers

Workers in these professions who took traditional college would normally earn an average of \$100,000 after graduating.

Most of these workers would have bachelor's degrees and master's degree.

The reason for this was because, the higher your education in these professions, the greater your earning potential.

Once bootcamps started becoming more prominent in today's society, workers no longer had to go to traditional college to make the same earnings in software engineering, cybersecurity, and data analytics.

Through bootcamp training in these professions,  
these individuals were able to earn just as much  
and even more than they would have taking  
traditional college!

The End
